

DDI DROP DIRECT/INDIRECT

White Perforated Shielding
with Aluminum Solid Louver
(WPASL)

DDI

Williams announces DDI, a flexible new direct-indirect luminaire that provides superior performance in a surface-mounted fixture. DDI gives specifiers a new option for lighting spaces where pendants won't work, parabolics would be too dark, and traditional wrap-arounds would be too plain.

DDI's construction shows the attention to detail that is a Williams hallmark. Heavy-gauge steel is carefully die-formed, welded, and powder coated after fabrication. Long runs of the fixture can be easily assembled with quick-clip wiring and trim connectors for a clean, seamless look.

Round Shielding (WPR)

A Visible Difference

Destiny Dance, Phoenix, AZ

DDI's arched wings reflect light horizontally to illuminate the ceiling, providing even luminance without glare. Although DDI is designed to be surface-mounted to hard or grid ceilings, it can also be suspended from aircraft cables or hung from solid stems.

The diffuser can be fitted with radial louvers or perforated metal with acrylic backing. A perforated reflector option provides five percent uplight for suspended applications.

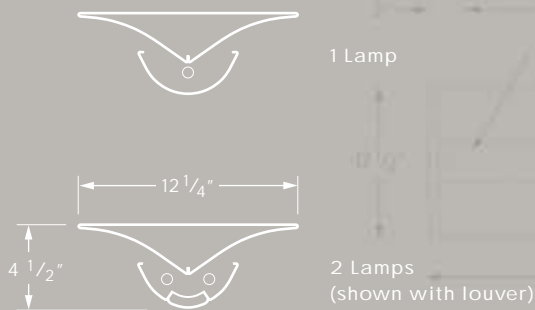

Retrofitting wrap-arounds is easy; the fixture covers up ceiling marks from the old fixtures. DDI is available with one or two T8, T5, or T5HO lamps.
